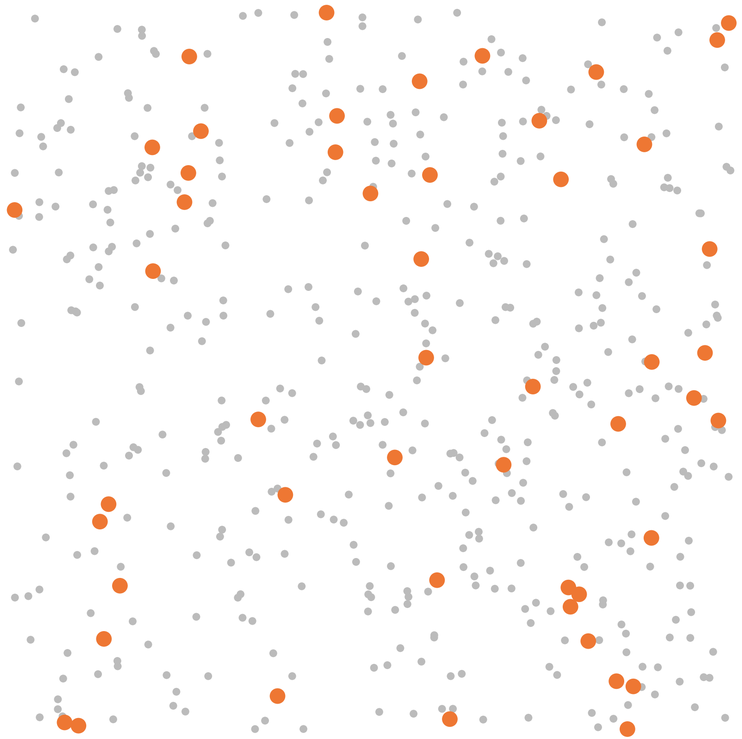
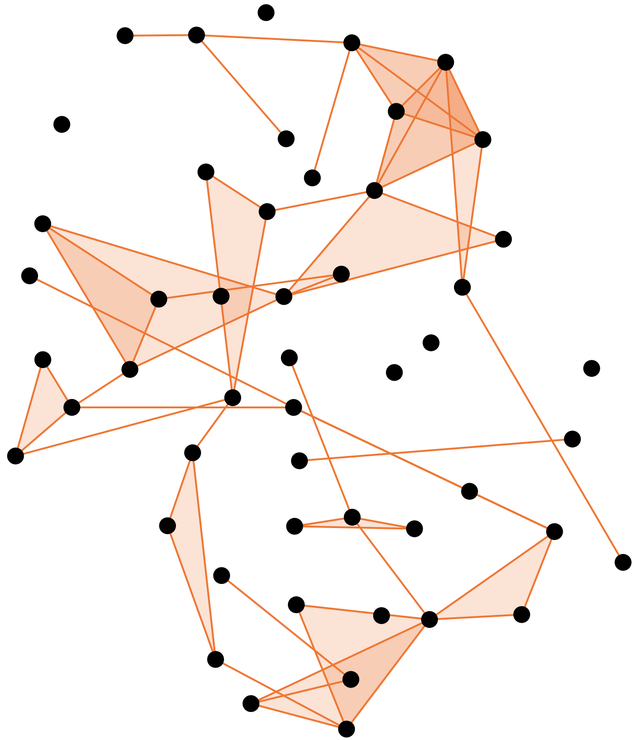
1. A trained 12-task network, 512 neurons:
50 drawn at random as a probe



2. Its 50 neurons joined by the top 5%
of correlations: 3 loops



Pugavko et al. 2023's spiking network, trained on 12 tasks (seed 0). The probe is drawn from the 282 neurons firing at least 1 Hz; its correlations are over 15000 bins of 10 ms from trials in random order. Positions are for display only: left at random, right pulled together by their correlation ranks, so strongly correlated neurons sit close. This probe's Betti 1 area is 0.29 of random's.
