	passive brain	engaged brain	spiking models	engaged > model
What separates them				
path length	16.5	9.7	4.4	99%
dimensions used	6.0	3.1	1.5	94%
trial-to-trial noise	0.18	0.11	0.05	98%
Topology, against its own noise				
clusters that survive resampling	36	10	8	
populations with a loop that survives	8 of 39	1 of 39	24 of 189	
longest loop / its own noise	1.18	0.68	0.76	

Medians at 128 neurons x 100 trials; n = 39, 39, 189. Path length: total cluster (H0) persistence, 95-99% of the path's length in its own widths. Dimensions: participation ratio. Noise: distance between signatures of two random halves of the trials. Survives resampling: longer than twice the 95th percentile of that noise. Descriptive, no test; models measured at 100 trials only; 50 x 56 agrees.
